1. Brainstorming & Ideation Phase

FitBuddy – AI Fitness Plan Generator using Gemini Models

Phase Report

Prepared from the supplied FitBuddy project documentation and organized into a project lifecycle deliverable.

1. Project Idea

FitBuddy is a web-based application that generates personalized 7-day workout plans and nutrition or recovery tips based on user fitness goals and preferences.

2. Problem Statement

People may find it difficult to create a structured workout routine that fits their goal, age, weight, and preferred intensity. Coaches may also need a simple way to review plans and track revisions.

3. Proposed Solution

Build a web application that collects basic user information, uses Google Gemini models to generate a day-wise plan, provides a related nutrition/recovery tip, and lets users submit feedback to refine the plan.

4. Target Users

Individual fitness users, students, fitness beginners, and coaches or administrators who need to review user plans.

5. Core Ideas and Features

Personalized 7-day workout generation; warm-up, main workout, and cooldown guidance; nutrition/recovery tip; feedback-based plan updates; SQLite storage; admin view of users and original/updated plans.

6. Expected Benefits

A structured starting point for fitness planning, easier plan revisions, persistent plan history, and a single interface for users and coaches.

7. Initial Technology Ideas

FastAPI for backend routing, HTML/CSS and Jinja2 templates for the interface, Google Gemini APIs for text generation, SQLAlchemy and SQLite for storage, and Uvicorn for local development.

8. Ideation Outcome

Proceed with a modular web application, separating user interface, routes, AI generation, database operations, and template rendering.

Note: This document describes the intended design and workflow. Test outcomes should be recorded only after the application has been run and verified.
