8. Project Demonstration Phase

FitBuddy – AI Fitness Plan Generator using Gemini Models

Phase Report

Prepared from the supplied FitBuddy project documentation and organized into a project lifecycle deliverable.

1. Demonstration Goal

Show the complete user journey from entering personal fitness details to generating a plan, receiving a tip, submitting feedback, and reviewing stored users.

2. Before the Demo

Confirm Python and dependencies are installed, .env contains a valid API key, the virtual environment is active, the SQLite database can be created, and the server starts without errors.

3. Demo Step 1 — Open the App

Run uvicorn app.main:app --reload and open http://127.0.0.1:8000. Explain that the homepage collects the information needed to personalize the plan.

4. Demo Step 2 — Generate a Plan

Enter a sample username, user ID, age, weight, fitness goal, and intensity. Submit the form. Show the generated seven-day schedule and point out warm-up, exercises, sets/reps or duration, and cooldown guidance.

5. Demo Step 3 — Nutrition/Recovery Tip

Highlight the concise tip generated for the selected goal and explain how it complements the workout schedule.

6. Demo Step 4 — Submit Feedback

Enter the same user ID and feedback such as “include more cardio and one additional rest day.” Submit and show the updated plan. Explain that the original plan is retained for comparison.

7. Demo Step 5 — Admin View

Open /view-all-users and show the stored user information and original/updated plan fields. Avoid displaying real personal data during a public demonstration.

8. Demo Step 6 — API Docs

Open http://127.0.0.1:8000/docs and explain the available API endpoints. Demonstrate API calls only if time permits.

9. Suggested Presentation Flow

Problem → proposed solution → architecture → technology stack → live plan generation → feedback update → database/admin view → testing summary → limitations and future enhancements.

10. Future Enhancements

Possible additions include authentication, user progress tracking, export to PDF, deployment, accessibility improvements, and more detailed test automation.

Note: This document describes the intended design and workflow. Test outcomes should be recorded only after the application has been run and verified.
